WE ARE WHAT THEY ATE: A HISTORY OF FOOD IN SOUTH CAROLINA

South Carolina Archaeology Month October 2007

Founding: An Introduction to Coastal and Cultural Contact

We are what they ate. The intersections between culture, food, and the environments in which they interact are complex, and food is a key component of human relationships, social organization, and identity. This is particularly true for the people of the Southeast, who have been influenced by contact for millennia. The archaeological record preserves the traces of their habits and behaviors, but it is also a window into their worldviews and cultural practices. In this issue of South Carolina Archaeology, we explore the complex relationships between food, culture, and environment in the southeastern United States, with a focus on South Carolina.

South Carolina is a state with a rich history, located at the crossroads of the Atlantic and the Appalachian mountains. It has been inhabited by humans for thousands of years, and its culture has been shaped by the interactions of Native American, African, and European peoples. The archaeological record of South Carolina is extensive, and it provides a rich source of information about the past. This issue of South Carolina Archaeology brings together a diverse range of voices to explore the complex relationships between food, culture, and environment in the southeastern United States.
